

1                                   **ABSTRACT OF THE DISCLOSURE**

2           A driving method of liquid crystal display. Voltage  
3 levels of pre-charging signals applied to storage  
4 electrodes vary before scan signals are applied to scan  
5 lines. Partial response voltage of the variations in  
6 voltage levels of pre-charging signals are respectively  
7 coupled to storage capacitors within pixels by  
8 capacitors. When the scan signals are applied to the  
9 scan lines, voltage swings of the pixel capacitors  
10 charged by image data on data lines decrease, rapidly  
11 charging the pixels.
